

1. (Amended) A display device comprising:

a display panel having a first light-transmissive substrate provided with electrodes at the area of pixels arranged in rows and columns, a second light-transmissive substrate and liquid crystalline material between the two substrates, the pixels comprising a plurality of groups of rows of pixels and a plurality of groups of columns of pixels;

an illumination system situated on the side of the second substrate remote from the liquid crystalline material, said illumination system comprising a backlight;

96 an optical shutter element including means for selectively transmitting light for one group of rows of pixels or one group of columns of pixels at a time to consecutively illuminate the groups of rows of pixels or groups of columns of pixels; and

at least one reflective polarizer in an optical path between the backlight and the display panel.

2. A display device as claimed in claim 1, characterized in that the illumination system comprises an optical waveguide (15) of an optically transparent material having an exit face (18) facing the display panel.

3. A display device as claimed in claim 2, characterized in that the display device comprises, parallel to the exit face, a reflective polarizer (35) between the exit face (18) and the display panel (2).

4. A display device as claimed in claim 2, characterized in that the display device comprises, parallel to the exit face, a second reflective polarizer (36) between the optical shutter element (21) and the display panel (2).

5. A display device as claimed in claim 1, characterized in that the optical shutter element is situated between the display panel and a second reflective polarizer (36).

6. A display device as claimed in claim 2, characterized in that the optical waveguide is provided with means for coupling in light in a direction parallel to the exit face.

7. A display device as claimed in claim 6, characterized in that the illumination system comprises at least one backlight (12) and an optical waveguide (15) having at least one entrance face (10) for light, while light from the backlight can be coupled in along the entrance face extending substantially transversely to the exit face, and a selectively switchable light switch (21') is situated between the backlight (12) and the entrance face (10).

8. A display device as claimed in claim 7, characterized in that a first reflective polarizer (35') is situated between the backlight (12) and the selectively switchable light switch (21').

9. A display device as claimed in claim 8, characterized in that a second reflective polarizer (36') is situated between the selectively switchable light switch (21') and the optical waveguide (15).

a7 10. (Amended) A display device as claimed in claim 1, wherein the display device comprises drive means for presenting signals to data and column electrodes to write data to the pixels, and for selectively activating at any one time only a part of the optical shutter system associated with the one group of rows of pixels or the one group of columns of pixels.

a8 11. (Newly Added) The display device of claim 1, wherein the optical shutter is disposed in the optical path between the illumination system and the display panel.

12. (Newly Added) The display device of claim 1, wherein the optical shutter includes a plurality of strip-shaped light transparent electrodes.

13. (Newly Added) The display device of claim 12, wherein the each of the
